TerraTV +

PCI Stereo TV Card

ReceiverSystem TerraTV+

The TerraTV+ tuner card is the next step into a new multimedia future. It lets you watch television comfortably on your computer and investigate the world of teletext.

The performance of the included 32-bit applications ensures the completely stable, flicker-free display of the TV picture on your PC monitor. The display can be scaled freely up to a size of 768 x 576. If that's not enough, use the full-screen mode for maximum screen area without distracting menus or tool bars. Are you looking for an interesting programme? The multiple-station preview mode of the TV software can give you a hand by presenting an overview of 100 channels simultaneously.

Forget about tiresome manual station selection. The search function of the TV software automates the installation of stations without manual intervention. The station names are also assigned and saved at the same time. The integrated capture function lets you make compressed recordings of running programmes from a connected video camera or VCR. The degree of compression is user-definable. These recordings can then be conveniently edited and effects applied using the included Ulead® Video Studio 3.0®. Use it to create unbelievable transition effects, let text passages elegantly flow across your screen, or polish your home videos with the audio dub function. Set your creativity free!

The included teletext software features high-speed display and very convenient handling. Forget about long waits and keying in page numbers. Simply navigate the world of teletext with your mouse. The teletext software has an internal buffer that automatically loads all of the available pages for a given programme, allowing them to be displayed at the touch of a key.

The ReceiverSystem TerraTV+ is a breeze to install, with a coaxial antenna connector for your regular TV antenna, a video input for a camera or VCR, and an SVHS input for high-quality SVHS components. Its simple connection options for video cameras or WebCams make the TerraTV+ ideal for videoconferences via the Internet. What's more, the TerraTV+ tuner card can be expanded to a full-featured RDS radio receiver with the optional TerraTec ActiveRadio module.

Technical Data

- Brooktree 878 chipset
- Famous video-editing Software Ulead – Video Studio 3.0
- Preview 100 channels simultaneously with the multiple station preview function
- View teletext faster than with any TV using the FastText function
- Automatic identification of all available stations by the integrated search function
- Compressed recording of AVI-format video sequences
- TV in full-screen mode or in a window (scalable to a maximum of 768 x 576)
- Stereo audio input and output
- SVHS and cinch inputs for external video sources
- Win95/98 compatible
- Provision for an optional TerraTec ActiveRadio Upgrade module

System Requirements

- Pentium 90 MHz
- Windows 95 or Windows 98
- 1 free PCI 2.1 master slot
- Active speakers or a sound card
- 1 free interrupt
- CD-ROM drive (to install the drivers and software)
- 1 PCI or AGP VGA card with DirectDraw drivers and VideoOverlay support
